NAME

pthread_attr_setstackaddr, pthread_attr_getstackaddr − set/get stack address attribute in thread attributes object

SYNOPSIS

#include <pthread.h>

int pthread_attr_setstackaddr(pthread_attr_t *_attr_, void *_stackaddr_);
int pthread_attr_getstackaddr(const pthread_attr_t *_attr_, void **_stackaddr_);

Compile and link with *−pthread*.

DESCRIPTION

These functions are obsolete: **do not use them.** Use **pthread_attr_setstack**(3) and **pthread_attr_getstack**(3) instead.

The **pthread_attr_setstackaddr**() function sets the stack address attribute of the thread attributes object referred to by *attr* to the value specified in *stackaddr*. This attribute specifies the location of the stack that should be used by a thread that is created using the thread attributes object *attr*.

stackaddr should point to a buffer of at least **PTHREAD_STACK_MIN** bytes that was allocated by the caller. The pages of the allocated buffer should be both readable and writable.

The **pthread_attr_getstackaddr**() function returns the stack address attribute of the thread attributes object referred to by *attr* in the buffer pointed to by *stackaddr*.

RETURN VALUE

On success, these functions return 0; on error, they return a nonzero error number.

ERRORS

No errors are defined (but applications should nevertheless handle a possible error return).

VERSIONS

These functions are provided by glibc since version 2.1.

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes**(7).

Interface	Attribute	Value
pthread_attr_setstackaddr(), **pthread_attr_getstackaddr**()	Thread safety	MT-Safe

CONFORMING TO

POSIX.1-2001 specifies these functions but marks them as obsolete. POSIX.1-2008 removes the specification of these functions.

NOTES

Do not use these functions! They cannot be portably used, since they provide no way of specifying the direction of growth or the range of the stack. For example, on architectures with a stack that grows downward, *stackaddr* specifies the next address past the *highest* address of the allocated stack area. However, on architectures with a stack that grows upward, *stackaddr* specifies the *lowest* address in the allocated stack area. By contrast, the *stackaddr* used by **pthread_attr_setstack**(3) and **pthread_attr_getstack**(3), is always a pointer to the lowest address in the allocated stack area (and the *stacksize* argument specifies the range of the stack).

SEE ALSO

pthread_attr_init(3), **pthread_attr_setstack**(3), **pthread_attr_setstacksize**(3), **pthread_create**(3), **pthreads**(7)

COLOPHON

This page is part of release 5.02 of the Linux *man-pages* project. A description of the project, information about reporting bugs, and the latest version of this page, can be found at https://www.kernel.org/doc/man−pages/.
