

NAME

Net::DNS::FAQ – Frequently Asked Net::DNS Questions

SYNOPSIS

```
perldoc Net::DNS::FAQ
```

DESCRIPTION

This document serves to answer the most frequently asked questions on both the Net::DNS Mailing List and those sent to the author.

The latest version of this FAQ can be found at [<http://www.net-dns.org/docs/FAQ.html>](http://www.net-dns.org/docs/FAQ.html)

GENERAL**What is Net::DNS?**

Net::DNS is a perl implementation of a DNS resolver.

INSTALLATION**Where can I find Test::More?**

Test::More is part of the Test-Simple package, by Michael G Schwern. You should be able to find the distribution at [<http://search.cpan.org/dist/Test-Simple/>](http://search.cpan.org/dist/Test-Simple/)

USAGE**Why does \$resolver->query() return undef when the answer section is empty?**

The short answer is, do not use **query()**. **\$resolver->send()** will always return the response packet, as long as a response was received.

The longer answer is that **query()** is modeled after the **res_query()** function from the libresolv C library, which has similar behavior.
