

NAME

Lintian::Path::FSInfo – File System information for Lintian::Path

SYNOPSIS

```
my $l_path; # A L::Path object
my $fs_info; # A L::Path::FSInfo object
if ($fs_info->has_anchored_root_dir) {
    # The "root" dir is anchored and paths starting with "/" can
    # trivially be resolved (as relative to the "root" dir).
} else {
    # The "root" dir is undefined and paths starting with "/" *cannot*
    # be resolved.
}
```

CLASS METHODS

new(OPTS)

Internal constructor (used by Lintian::Collect::Package)

INSTANCE METHODS

_underlying_fs_path(PATH)

Given PATH, a Lintian::Path, obtain the underlying file system path that it represents.

_file_info(PATH)

Given PATH, a Lintian::Path, obtain the output from **file**(1) about the file, if it has been collected. Throws an error if it not available.

has_anchored_root_dir

Returns a truth value if the “root” directory is anchored and is defined by the path string “/”. In such cases, paths starting with “/” are well-defined semantically and are relative to the root directory rather than the “current” directory.

On the other hand, if this returns a non-truth value, the “root” directory is *not* well-defined and no path starting with “/” can be resolved logically.
