

NAME

who-uploads – identify the uploaders of Debian source packages

SYNOPSIS

who-uploads [*options*] *source_package* ...

DESCRIPTION

who-uploads uses the Package Tracking System (PTS) to identify the uploaders of the three most recent versions of the given source packages. Note that the uploaders are identified using their **gpg(1)** or **gpg2(1)** keys; installing a recent version of the *debian-keyring* package should provide most of the required keys.

Note that because the PTS uses source packages, you must give the source package names, not the binary package names.

OPTIONS

-M, --max-uploads=N

Specify the maximum number of uploads to display for each package; the default is 3. Note that you may not see this many uploads if there are not this many recorded in the PTS.

--keyring *keyring*

Add *keyring* to the list of keyrings to be searched for the uploader's GPG key.

--no-default-keyrings

By default, **who-uploads** uses the two Debian keyrings */usr/share/keyrings/debian-keyring.gpg* and */usr/share/keyrings/debian-maintainers.gpg* (although this default can be changed in the configuration file, see below). Specifying this option means that the default keyrings will not be examined. The **--keyring** option overrides this one.

--date Show the date of the upload alongside the uploader's details

--nodate, --no-date

Do not show the date of the upload alongside the uploader's details. This is the default behaviour.

--no-conf, --noconf

Do not read any configuration files. This can only be used as the first option given on the command-line.

--help, -h

Display a help message and exit successfully.

--version

Display version and copyright information and exit successfully.

CONFIGURATION VARIABLES

The two configuration files */etc/devscripts.conf* and *~/devscripts* are sourced in that order to set configuration variables. Command line options can be used to override configuration file settings. Environment variable settings are ignored for this purpose. The currently recognised variables are:

WHOUUPLOADS_DATE

Show the date of the upload alongside the uploader's details. By default, this is "no".

WHOUUPLOADS_MAXUPLOADS

The maximum number of uploads to display for each package. By default, this is 3.

WHOUUPLOADS_KEYRINGS

This is a colon-separated list of the default keyrings to be used. By default, it is the two Debian keyrings */usr/share/keyrings/debian-keyring.gpg* and */usr/share/keyrings/debian-maintainers.gpg*.

AUTHOR

The original version of **who-uploads** was written by Adeodato Simó <dato@net.com.org.es>. The current version is by Julian Gilbey <jdg@debian.org>.
