

NAME

im-launch – launch input method and execute session program

SYNOPSIS

im-launch *SESSION-PROGRAM*

DESCRIPTION

The **im-launch** command is used to start an input method framework server daemon such as **ibus-daemon**, set up the appropriate environment variables for the client programs, and execute *SESSION-PROGRAM* such as **x-session-manager**.

This command is usually not invoked from the console of a normal user but is normally invoked by the */etc/X11/Xsession.d/70im-config_launch*.

TROUBLESHOOT

If you have any problem, see the first part of *~/xsession-errors* and look for the cause. If you are running **im-config** while Debian (sid) system is undergoing a major library transition, you may need to manually set up *~/xinputrc* with adjusted library version number etc. Please file a bug report to the **im-config** package using *reportbug(1)* describing your resolution experience.
