

NAME

showconsolefont – Show the current EGA/VGA console screen font

SYNOPSIS

showconsolefont [**-V** | **--version**] [**-v**] [**-i**] [**-C** *console*]

DESCRIPTION

The **showconsolefont** command outputs the current console font to stdout. The option **-v** prints additional information, while the option **-V** prints the program version number. The option **-i** doesn't print out the font table, just shows ROWSxCOLSxCOUNT and exits. On Linux 2.6.1 and later, the option **-C** allows one to indicate the console involved. Its argument is a pathname.
