

NAME

AnyEvent::IO::Perl – pure perl backend for AnyEvent::IO

SYNOPSIS

```
use AnyEvent::IO;
```

DESCRIPTION

This is the pure-perl backend of AnyEvent::IO – it is always available, but does not actually implement any I/O operation asynchronously – everything is synchronous.

For simple programs that can wait for I/O, this is likely the most efficient implementation.

SEE ALSO

AnyEvent::IO, AnyEvent.
