

NAME

strsep – extract token from string

SYNOPSIS

```
#include <string.h>
```

```
char *strsep(char **stringp, const char *delim);
```

Feature Test Macro Requirements for glibc (see **feature_test_macros(7)**):

strsep():

Since glibc 2.19:

_DEFAULT_SOURCE

Glibc 2.19 and earlier:

_BSD_SOURCE

DESCRIPTION

If **stringp* is NULL, the **strsep()** function returns NULL and does nothing else. Otherwise, this function finds the first token in the string **stringp*, that is delimited by one of the bytes in the string *delim*. This token is terminated by overwriting the delimiter with a null byte ('\0'), and **stringp* is updated to point past the token. In case no delimiter was found, the token is taken to be the entire string **stringp*, and **stringp* is made NULL.

RETURN VALUE

The **strsep()** function returns a pointer to the token, that is, it returns the original value of **stringp*.

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes(7)**.

Interface	Attribute	Value
strsep()	Thread safety	MT-Safe

CONFORMING TO

4.4BSD.

NOTES

The **strsep()** function was introduced as a replacement for **strtok(3)**, since the latter cannot handle empty fields. However, **strtok(3)** conforms to C89/C99 and hence is more portable.

BUGS

Be cautious when using this function. If you do use it, note that:

- * This function modifies its first argument.
- * This function cannot be used on constant strings.
- * The identity of the delimiting character is lost.
