

NAME

deb-systemd-invoke – wrapper around systemctl, respecting policy-rc.d

SYNOPSIS

deb-systemd-invoke start|stop|restart *unitfile*...

DESCRIPTION

deb-systemd-invoke is a Debian-specific helper script which asks `/usr/sbin/policy-rc.d` before performing a `systemctl` call.

deb-systemd-invoke is intended to be used from maintscripts to start systemd unit files. It is specifically NOT intended to be used interactively by users. Instead, users should run `systemd` and use `systemctl`, or not bother about the systemd enabled state in case they are not running systemd.
