args2

num_args1 Specifies

num_args2 Specifies

name Specifies

value Specifies the va

DESCRIPTION

The **XtSetArg** function is usually used in a **ArgList** structure; for example:

Alternatively, an application can statically declare the argument list and use **XtNumber**:

Note that you should not use auto-increment or auto-decrement within the first argument to **XtSetArg**. **XtSetArg** can be implemented as a macro that dereferences the first argument twice.

The **XtMergeArgLists** function allocates enough storage to hold the combined **ArgList** structures and copies them into it. Note that it does not check for duplicate entries. When it is no longer needed, free the returned storage by using **XtFree**.
