

NAME

Pango::AttrLanguage – used to represent attributes that are languages

HIERARCHY

```
Glib::Boxed
+----Pango::AttrLanguage
```

METHODS

attribute = Pango::AttrLanguage->new (\$language, ...)

- \$language (Pango::Language)
- ... (list)

Pango::AttrLanguage doesn't take a reference and doesn't copy the Pango::Language object, but demands its validity nonetheless. So make sure the language object stays alive at least as long as the attribute.

language = \$attr->value (...)

- ... (list)
