

NAME

opendir, fdopendir – open a directory

SYNOPSIS

```
#include <sys/types.h>
```

```
#include <dirent.h>
```

```
DIR *opendir(const char *name);
```

```
DIR *fdopendir(int fd);
```

Feature Test Macro Requirements for glibc (see **feature_test_macros(7)**):

```
fdopendir():
```

Since glibc 2.10:

```
_POSIX_C_SOURCE >= 200809L
```

Before glibc 2.10:

```
_GNU_SOURCE
```

DESCRIPTION

The **opendir()** function opens a directory stream corresponding to the directory *name*, and returns a pointer to the directory stream. The stream is positioned at the first entry in the directory.

The **fdopendir()** function is like **opendir()**, but returns a directory stream for the directory referred to by the open file descriptor *fd*. After a successful call to **fdopendir()**, *fd* is used internally by the implementation, and should not otherwise be used by the application.

RETURN VALUE

The **opendir()** and **fdopendir()** functions return a pointer to the directory stream. On error, NULL is returned, and *errno* is set appropriately.

ERRORS**EACCES**

Permission denied.

EBADF

fd is not a valid file descriptor opened for reading.

EMFILE

The per-process limit on the number of open file descriptors has been reached.

ENFILE

The system-wide limit on the total number of open files has been reached.

ENOENT

Directory does not exist, or *name* is an empty string.

ENOMEM

Insufficient memory to complete the operation.

ENOTDIR

name is not a directory.

VERSIONS

fdopendir() is available in glibc since version 2.4.

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes(7)**.

Interface	Attribute	Value
opendir() , fdopendir()	Thread safety	MT-Safe

CONFORMING TO

opendir() is present on SVr4, 4.3BSD, and specified in POSIX.1-2001. **fdopendir()** is specified in POSIX.1-2008.

NOTES

Filename entries can be read from a directory stream using **readdir(3)**.

The underlying file descriptor of the directory stream can be obtained using **dirfd(3)**.

The **opendir()** function sets the close-on-exec flag for the file descriptor underlying the *DIR* *. The **fdopendir()** function leaves the setting of the close-on-exec flag unchanged for the file descriptor, *fd*. POSIX.1-200x leaves it unspecified whether a successful call to **fdopendir()** will set the close-on-exec flag for the file descriptor, *fd*.

SEE ALSO

open(2), **closedir(3)**, **dirfd(3)**, **readdir(3)**, **rewinddir(3)**, **scandir(3)**, **seekdir(3)**, **telldir(3)**

COLOPHON

This page is part of release 5.02 of the Linux *man-pages* project. A description of the project, information about reporting bugs, and the latest version of this page, can be found at <https://www.kernel.org/doc/man-pages/>.
