

**NAME**

geteltorito – an El Torito boot image extractor

**SYNOPSIS**

**geteltorito** <image|device> [**-o** *outputfile*]

**DESCRIPTION**

**geteltorito** is a Perl script which extracts the initial/default **El Torito** boot image from a CD if one exists. It will not extract any of other boot images that are allowed by the El Torito standard.

The boot image file is written to **stdout** and all other information (e.g., image type and size) is written to **stderr**. To write the image to a file instead of **stdout**, specify the output filename using **-o filename**.

**SEE ALSO**

**genisoimage**(1), **isoinfo**(1).

**AUTHOR**

geteltorito was written by Rainer Krienke <krienke@uni-koblenz.de>.

This manual page was written by Eduard Bloch <blade@debian.org> based on README.geteltorito from geteltorito-0.4 package.
