

NAME

iswdigit – test for decimal digit wide character

SYNOPSIS

```
#include <wctype.h>

int iswdigit(wint_t wc);
```

DESCRIPTION

The **iswdigit()** function is the wide-character equivalent of the **isdigit(3)** function. It tests whether *wc* is a wide character belonging to the wide-character class "digit".

The wide-character class "digit" is a subclass of the wide-character class "xdigit", and therefore also a subclass of the wide-character class "alnum", of the wide-character class "graph" and of the wide-character class "print".

Being a subclass of the wide character class "print", the wide-character class "digit" is disjoint from the wide-character class "cntrl".

Being a subclass of the wide-character class "graph", the wide-character class "digit" is disjoint from the wide-character class "space" and its subclass "blank".

Being a subclass of the wide-character class "alnum", the wide-character class "digit" is disjoint from the wide-character class "punct".

The wide-character class "digit" is disjoint from the wide-character class "alpha" and therefore also disjoint from its subclasses "lower", "upper".

The wide-character class "digit" always contains exactly the digits '0' to '9'.

RETURN VALUE

The **iswdigit()** function returns nonzero if *wc* is a wide character belonging to the wide-character class "digit". Otherwise, it returns zero.

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes(7)**.

| Interface | Attribute | Value |
|-------------------|---------------|----------------|
| iswdigit() | Thread safety | MT-Safe locale |

CONFORMING TO

POSIX.1-2001, POSIX.1-2008, C99.

NOTES

The behavior of **iswdigit()** depends on the **LC_CTYPE** category of the current locale.

SEE ALSO

isdigit(3), **iswctype(3)**
