

**NAME**

`fgetc`, `getc` – read a wide character from a FILE stream

**SYNOPSIS**

```
#include <stdio.h>
#include <wchar.h>

wint_t fgetc(FILE *stream);
wint_t getc(FILE *stream);
```

**DESCRIPTION**

The **fgetc()** function is the wide-character equivalent of the **fgetc(3)** function. It reads a wide character from *stream* and returns it. If the end of stream is reached, or if *ferror(stream)* becomes true, it returns **WEOF**. If a wide-character conversion error occurs, it sets *errno* to **EILSEQ** and returns **WEOF**.

The **getc()** function or macro functions identically to **fgetc()**. It may be implemented as a macro, and may evaluate its argument more than once. There is no reason ever to use it.

For nonlocking counterparts, see **unlocked\_stdio(3)**.

**RETURN VALUE**

The **fgetc()** function returns the next wide-character from the stream, or **WEOF**. In the event of an error, *errno* is set to indicate the cause.

**ERRORS**

Apart from the usual ones, there is

**EILSEQ**

The data obtained from the input stream does not form a valid character.

**ATTRIBUTES**

For an explanation of the terms used in this section, see **attributes(7)**.

Interface	Attribute	Value
<b>fgetc()</b> , <b>getc()</b>	Thread safety	MT-Safe

**CONFORMING TO**

POSIX.1-2001, POSIX.1-2008, C99.

**NOTES**

The behavior of **fgetc()** depends on the **LC\_CTYPE** category of the current locale.

In the absence of additional information passed to the **fopen(3)** call, it is reasonable to expect that **fgetc()** will actually read a multibyte sequence from the stream and then convert it to a wide character.
