

NAME

`ubuntu-distro-info` – provides information about Ubuntu's distributions

SYNOPSIS

`ubuntu-distro-info` [*OPTIONS*]

OPTIONS

--date=DATE

date for calculating the version (default: today)

-h, --help

display help message and exit

-a, --all

list all known versions

-y[MILESTONE], --days[=MILESTONE]

display number of days until specified version reaches the specified milestone. *MILESTONE* may be one of *created*, *release*, *eol*, or *eol-server*. If no milestone is specified, assume *release*. For options that return a list, display the normal output followed by whitespace and the number of days until the specified milestone. If milestone cannot be calculated (for example if the *eol-server* milestone is specified for a non-server release), the string '(unknown)' is displayed. Unless one of **-c**, **-f** or **-r** is specified, only the number of days will be displayed.

-d, --devel

latest development version

-l, --latest

prints the latest development version. In case of outdated distribution data, the latest stable version will be printed.

--lts latest long term support (LTS) version

--series=SERIES

series to calculate the version for

-s, --stable

latest stable version

--supported

list of all supported stable versions

--unsupported

list of all unsupported stable versions

-c, --codename

print the codename (default)

-r, --release

print the release version

-f, --fullname

print the full name
