

NAME

seeded-in-ubuntu – Determine whether a package is safe to upload during a freeze

SYNOPSIS

seeded-in-ubuntu [*options*] *package*...

DESCRIPTION

Lists all the current daily images containing the specified packages. Or whether the package is part of the supported seed.

If it isn't on an image, it should be safe to upload. During the final freeze, one should avoid packages in the supported seed too.

An index of the current manifests is downloaded from UbuntuWire.

OPTIONS

-b, --binary

The packages specified are binary packages. This is faster than source packages, as otherwise we must query LP to determine the binary packages that every specified source package builds.

-u URL, --data-url=URL

URL for index of seeded packages. Default: UbuntuWire's service at <http://qa.ubuntuwire.org/ubuntu-seeded-packages/seeded.json.gz>.

-h, --help

Display a help message and exit

EXAMPLES

All the images that contain unity:

seeded-in-ubuntu -b unity
