

**NAME**

`python-config` – output build options for python C/C++ extensions or embedding

**SYNOPSIS**

`python-config` [ `--prefix` ] [ `--exec-prefix` ] [ `--includes` ] [ `--libs` ] [ `--cflags` ] [ `--ldflags` ] [ `--extension-suffix` ] [ `--configdir` ] [ `--help` ]

**DESCRIPTION**

`python-config` helps compiling and linking programs, which embed the Python interpreter, or extension modules that can be loaded dynamically (at run time) into the interpreter.

**OPTIONS****--cflags**

print the C compiler flags.

**--ldflags**

print the flags that should be passed to the linker.

**--includes**

similar to `--cflags` but only with `-I` options (path to python header files).

**--libs** similar to `--ldflags` but only with `-l` options (used libraries).

**--prefix**

prints the prefix (base directory) under which python can be found.

**--exec-prefix**

print the prefix used for executable program directories (such as `bin`, `sbin`, etc).

**--extension-suffix**

print suffix used for extension modules (including the `_d` modified for debug builds).

**--configdir**

prints the path to the configuration directory under which the Makefile, etc. can be found).

**--help** print the usage message.

**EXAMPLES**

To build the single-file c program *prog* against the python library, use

```
gcc $(python-config --cflags --ldflags) progr.cpp -o progr.cpp
```

The same in a makefile:

```
CFLAGS+=$(shell python-config --cflags)
LDFLAGS+=$(shell python-config --ldflags)
all: progr
```

To build a dynamically loadable python module, use

```
gcc $(python-config --cflags --ldflags) -shared -fPIC progr.cpp -o progr.so
```
