

NAME

XtPopdown, XtCallbackPopdown – unmap a pop-up

SYNTAX

```
void XtPopdown(Widget popup_shell);
```

```
void XtCallbackPopdown(Widget w, XtPointer client_data, XtPointer call_data);
```

```
void MenuPopdown(String shell_name);
```

ARGUMENTS

<i>call_data</i>	Specifies the callback data, which is not used by this procedure.
<i>client_data</i>	Specifies a pointer to the XtPopdownID structure.
<i>popup_shell</i>	Specifies the widget shell to pop down.
<i>shell_name</i>	Specifies the name of the widget shell to pop down.
<i>w</i>	Specifies the widget.

DESCRIPTION

The **XtPopdown** function performs the following:

- Calls **XtCheckSubclass** to ensure *popup_shell* is a subclass of **Shell**.
- Checks that *popup_shell* is currently popped_up; otherwise, it generates an error.
- Unmaps *popup_shell*'s window.
- If *popup_shell*'s *grab_kind* is either **XtGrabNonexclusive** or **XtGrabExclusive**, it calls **XtRemoveGrab**.
- Sets pop-up shell's popped_up field to **False**.
- Calls the callback procedures on the shell's popdown_callback list.

The **XtCallbackPopdown** function casts the client data parameter to an **XtPopdownID** pointer:

The *shell_widget* is the pop-up shell to pop down, and the *enable_widget* is the widget that was used to pop it up.

XtCallbackPopdown calls **XtPopdown** with the specified *shell_widget* and then calls **XtSetSensitive** to resensitize the *enable_widget*.

If a shell name is not given, **MenuPopdown** calls **XtPopdown** with the widget for which the translation is specified. If a *shell_name* is specified in the translation table, **MenuPopdown** tries to find the shell by looking up the widget tree starting at the parent of the widget in which it is invoked. If it finds a shell with the specified name in the pop-up children of that parent, it pops down the shell; otherwise, it moves up the parent chain as needed. If **MenuPopdown** gets to the application top-level shell widget and cannot find a matching shell, it generates an error.
