

**NAME**

plymouthd – The plymouth daemon

**SYNOPSIS**

**plymouthd** [**OPTION...**]

**DESCRIPTION**

The **plymouthd** daemon is usually run out of the initrd. It does the heavy lifting of the plymouth system, logging the session and showing the splash screen.

The **plymouth** is used to send commands to plymouthd that control its behaviour.

**OPTIONS**

The following options are understood:

**--help**

Show summary of options.

**--attach-to-session**

Redirect console messages from screen to log.

**--no-daemon**

Do not daemonize.

**--debug**

Output debugging information.

**--debug-file=STRING**

File to write debugging information to.

**--mode=MODE**

Set mode to either boot or shutdown.

**--pid-file=STRING**

Write the PID of the daemon to a file.

**--kernel-command-line=STRING**

Fake kernel commandline to use.

**--tty=STRING**

TTY to use instead of default.
