

**NAME**

`fma`, `fmaf`, `fmal` – floating-point multiply and add

**SYNOPSIS**

```
#include <math.h>
```

```
double fma(double x, double y, double z);
```

```
float fmaf(float x, float y, float z);
```

```
long double fmал(long double x, long double y, long double z);
```

Link with `-lm`.

Feature Test Macro Requirements for glibc (see **feature\_test\_macros(7)**):

```
fma(), fmaf(), fmал():
```

```
_ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L
```

**DESCRIPTION**

These functions compute  $x * y + z$ . The result is rounded as one ternary operation according to the current rounding mode (see **fenv(3)**).

**RETURN VALUE**

These functions return the value of  $x * y + z$ , rounded as one ternary operation.

If  $x$  or  $y$  is a NaN, a NaN is returned.

If  $x$  times  $y$  is an exact infinity, and  $z$  is an infinity with the opposite sign, a domain error occurs, and a NaN is returned.

If one of  $x$  or  $y$  is an infinity, the other is 0, and  $z$  is not a NaN, a domain error occurs, and a NaN is returned.

If one of  $x$  or  $y$  is an infinity, and the other is 0, and  $z$  is a NaN, a domain error occurs, and a NaN is returned.

If  $x$  times  $y$  is not an infinity times zero (or vice versa), and  $z$  is a NaN, a NaN is returned.

If the result overflows, a range error occurs, and an infinity with the correct sign is returned.

If the result underflows, a range error occurs, and a signed 0 is returned.

**ERRORS**

See **math\_error(7)** for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

Domain error:  $x * y + z$ , or  $x * y$  is invalid and  $z$  is not a NaN

An invalid floating-point exception (**FE\_INVALID**) is raised.

Range error: result overflow

An overflow floating-point exception (**FE\_OVERFLOW**) is raised.

Range error: result underflow

An underflow floating-point exception (**FE\_UNDERFLOW**) is raised.

These functions do not set *errno*.

**VERSIONS**

These functions first appeared in glibc in version 2.1.

**ATTRIBUTES**

For an explanation of the terms used in this section, see **attributes(7)**.

Interface	Attribute	Value
<b>fma()</b> , <b>fmaf()</b> , <b>fmал()</b>	Thread safety	MT-Safe

**CONFORMING TO**

C99, POSIX.1-2001, POSIX.1-2008.
