

**NAME**

FcStrCopyFilename – create a complete path from a filename

**SYNOPSIS**

```
#include <fontconfig/fontconfig.h>
```

```
FcChar8 * FcStrCopyFilename (const FcChar8 *s);
```

**DESCRIPTION**

**FcStrCopyFilename** constructs an absolute pathname from *s*. It converts any leading '~' characters in to the value of the HOME environment variable, and any relative paths are converted to absolute paths using the current working directory. Sequences of '/' characters are converted to a single '/', and names containing the current directory '.' or parent directory '..' are correctly reconstructed. Returns NULL if '~' is the leading character and HOME is unset or disabled (see **FcConfigEnableHome**).
