

NAME

split-logfile - Split combined virtual hosts access log into one file per virtual host

SYNOPSIS

split-logfile < *logfile*

SUMMARY

This script will take a combined Web server access log file and break its contents into separate files. It assumes that the first field of each line is the virtual host identity (put there by "%v"), and that the logfiles should be named that+".log" in the current directory.

The combined log file is read from stdin. Records read will be appended to any existing log files.

EXAMPLES

split-logfile < /var/log/apache2/other_vhosts_access.log
