

NAME

getbuildlog – download build logs from Debian auto-builders

SYNOPSIS

getbuildlog *package* [*version-pattern*] [*architecture-pattern*]

DESCRIPTION

getbuildlog downloads build logs of *package* from Debian auto-builders. It downloads build logs of all versions and for all architectures if *version-pattern* and *architecture-pattern* are not specified or empty, otherwise only build logs whose versions match *version-pattern* and build logs whose architectures match *architecture-pattern* will be downloaded. The version and architecture patterns are interpreted as extended regular expressions as described in **grep**(1).

If *version-pattern* is "last" then only the logs for the most recent version of *package* found on builddd.debian.org will be downloaded.

If *version-pattern* is "last-all" then the logs for the most recent version found on each build log index will be downloaded.

OPTIONS

-h, --help

Show usage information and examples.

-V, --version

Show version and copyright information.

EXAMPLES

getbuildlog hello 2\2-1 amd64

Download amd64 build log for hello version 2.2-1.

getbuildlog glibc "" mips.*

Download mips(el) build logs of all glibc versions.

getbuildlog wesnoth .*bpo.*

Download all build logs of backported wesnoth versions.
