

NAME

memfrob – frobnicate (encrypt) a memory area

SYNOPSIS

```
#define _GNU_SOURCE      /* See feature_test_macros(7) */
#include <string.h>

void *memfrob(void *s, size_t n);
```

DESCRIPTION

The **memfrob()** function encrypts the first *n* bytes of the memory area *s* by exclusive-ORing each character with the number 42. The effect can be reversed by using **memfrob()** on the encrypted memory area.

Note that this function is not a proper encryption routine as the XOR constant is fixed, and is suitable only for hiding strings.

RETURN VALUE

The **memfrob()** function returns a pointer to the encrypted memory area.

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes(7)**.

Interface	Attribute	Value
memfrob()	Thread safety	MT-Safe

CONFORMING TO

The **memfrob()** function is unique to the GNU C Library.

SEE ALSO
