

NAME

`xfce4-power-manager-settings` – Settings dialog for the Xfce 4 Power manager

SYNOPSIS

`xfce4-power-manager-settings` [*options*]

DESCRIPTION

xfce4-power-manager-settings is a utility that comes with the Xfce4 power manager to access/change its configuration. It is a separate program that uses `xfconf` to load/save settings according to the user's choices. **xfce4-power-manager-settings** requires the Xfce4 power manager to be running because it connects to it via Dbus and gets information about which settings should and should not be displayed; for example, the **xfce4-power-manager-settings** utility will not show the LCD brightness settings if no device was detected by the running instance of the Xfce4 power manager.

You can run **xfce4-power-manager-settings** from the command line without specifying any extra arguments.

OPTIONS**--debug**

Have the power manager print debug messages to the console; useful if you have to send in a bug report.

--socket-id=SOCKET ID

Settings manager socket, used when **xfce4-power-manager-settings** is embedded in the settings manager.

--device-id=UpDevice object path

Display a specific device by a specific UPower UpDevice object path.

BUGS

Please report any bugs to <http://bugzilla.xfce.org/>. Development discussion should be conducted on the xfce4-dev@xfce.org mailing list. Usage related questions should be directed to the xfce@xfce.org mailing list. See: <https://mail.xfce.org/mailman/listinfo/>
