

NAME

crc32 – compute CRC-32 checksums for the given files

SYNOPSIS

crc32 *filename* [*filename ...*]

DESCRIPTION

crc32 is a simple utility that calculates the CRC-32 checksum for each of the given files.

Note that the CRC-32 checksum is merely used for error detection in transmission and storage. It is not intended to guard against the malicious modification of files (i.e., it is not a cryptographic hash).

This utility is supplied with the **Archive::Zip** module for Perl.

SEE ALSO

Archive::Zip(3pm).

AUTHOR

The Archive::Zip module was written by Ned Konz.

This manual page was prepared by Ben Burton <bab@debian.org> for the Debian GNU/Linux system (but may be used by others).
