

NAME

cilc – Mono CIL-to-C binding generator

SYNOPSIS

cilc [options] *assembly target*

DESCRIPTION

cilc is the Mono CIL-to-C binding generator. It takes a CIL assembly as input and generates a directory of C sources which, when compiled, provide a C interface to the classes contained within that assembly by means of a shared object library.

Generated sources make use of the Mono embedding API. Thus a complete Mono development environment must be available on the development system and a complete Mono runtime environment must be available on target systems.
