

NAME

oo – syntactic sugar for Moo oneliners

SYNOPSIS

```
perl -Moo=Foo -e 'has bar => ( is => q[ro], default => q[baz] ); print Foo->new
```

```
# loads an existing class and re-"opens" the package definition
```

```
perl -Moo=+My::Class -e 'print __PACKAGE__->new->bar'
```

DESCRIPTION

oo.pm is a simple source filter that adds `package $name; use Moo;` to the beginning of your script, intended for use on the command line via the `-M` option.
