#### **NAME**

regcomp, regexec, regerror, regfree - POSIX regex functions

#### **SYNOPSIS**

#### DESCRIPTION

#### **POSIX regex compiling**

regcomp() is used to compile a regular expression into a form that is suitable for subsequent regexec()
searches

**regcomp**() is supplied with *preg*, a pointer to a pattern buffer storage area; *regex*, a pointer to the null-terminated string and *cflags*, flags used to determine the type of compilation.

All regular expression searching must be done via a compiled pattern buffer, thus **regexec**() must always be supplied with the address of a **regcomp**() initialized pattern buffer.

*cflags* may be the bitwise-**or** of zero or more of the following:

#### **REG\_EXTENDED**

Use **POSIX** Extended Regular Expression syntax when interpreting *regex*. If not set, **POSIX** Basic Regular Expression syntax is used.

#### **REG\_ICASE**

Do not differentiate case. Subsequent **regexec**() searches using this pattern buffer will be case insensitive.

# **REG\_NOSUB**

Do not report position of matches. The *nmatch* and *pmatch* arguments to **regexec**() are ignored if the pattern buffer supplied was compiled with this flag set.

#### **REG NEWLINE**

Match-any-character operators don't match a newline.

A nonmatching list ([^...]) not containing a newline does not match a newline.

Match-beginning-of-line operator (^) matches the empty string immediately after a newline, regardless of whether *eflags*, the execution flags of **regexec**(), contains **REG\_NOTBOL**.

Match-end-of-line operator (\$) matches the empty string immediately before a newline, regardless of whether *eflags* contains **REG\_NOTEOL**.

### **POSIX** regex matching

**regexec**() is used to match a null-terminated string against the precompiled pattern buffer, *preg. nmatch* and *pmatch* are used to provide information regarding the location of any matches. *eflags* may be the bitwise-or of one or both of **REG\_NOTBOL** and **REG\_NOTEOL** which cause changes in matching behavior described below.

### **REG\_NOTBOL**

The match-beginning-of-line operator always fails to match (but see the compilation flag **REG\_NEWLINE** above). This flag may be used when different portions of a string are passed to **regexec**() and the beginning of the string should not be interpreted as the beginning of the line.

#### **REG\_NOTEOL**

The match-end-of-line operator always fails to match (but see the compilation flag **REG\_NEW-LINE** above).

#### Byte offsets

Unless **REG\_NOSUB** was set for the compilation of the pattern buffer, it is possible to obtain match addressing information. pmatch must be dimensioned to have at least nmatch elements. These are filled in by **regexec()** with substring match addresses. The offsets of the subexpression starting at the ith open parenthesis are stored in pmatch[i]. The entire regular expression's match addresses are stored in pmatch[0]. (Note that to return the offsets of N subexpression matches, nmatch must be at least N+1.) Any unused structure elements will contain the value -1.

The *regmatch\_t* structure which is the type of *pmatch* is defined in *<regex.h>*.

```
typedef struct {
    regoff_t rm_so;
    regoff_t rm_eo;
} regmatch_t;
```

Each  $rm\_so$  element that is not -1 indicates the start offset of the next largest substring match within the string. The relative  $rm\_eo$  element indicates the end offset of the match, which is the offset of the first character after the matching text.

### **POSIX** error reporting

**regerror**() is used to turn the error codes that can be returned by both **regcomp**() and **regexec**() into error message strings.

**regerror**() is passed the error code, errcode, the pattern buffer, preg, a pointer to a character string buffer, errbuf, and the size of the string buffer,  $errbuf\_size$ . It returns the size of the errbuf required to contain the null-terminated error message string. If both errbuf and  $errbuf\_size$  are nonzero, errbuf is filled in with the first  $errbuf\_size - 1$  characters of the error message and a terminating null byte ("\0').

### **POSIX** pattern buffer freeing

Supplying **regfree**() with a precompiled pattern buffer, *preg* will free the memory allocated to the pattern buffer by the compiling process, **regcomp**().

#### **RETURN VALUE**

**regcomp**() returns zero for a successful compilation or an error code for failure.

regexec() returns zero for a successful match or REG\_NOMATCH for failure.

#### **ERRORS**

The following errors can be returned by **regcomp**():

#### **REG BADBR**

Invalid use of back reference operator.

## **REG BADPAT**

Invalid use of pattern operators such as group or list.

#### **REG BADRPT**

Invalid use of repetition operators such as using '\*' as the first character.

# **REG\_EBRACE**

Un-matched brace interval operators.

#### **REG EBRACK**

Un-matched bracket list operators.

### **REG\_ECOLLATE**

Invalid collating element.

### REG ECTYPE

Unknown character class name.

#### **REG\_EEND**

Nonspecific error. This is not defined by POSIX.2.

### **REG\_EESCAPE**

Trailing backslash.

### **REG EPAREN**

Un-matched parenthesis group operators.

### **REG\_ERANGE**

Invalid use of the range operator; for example, the ending point of the range occurs prior to the starting point.

### **REG\_ESIZE**

Compiled regular expression requires a pattern buffer larger than 64 kB. This is not defined by POSIX.2.

### **REG ESPACE**

The regex routines ran out of memory.

#### **REG\_ESUBREG**

Invalid back reference to a subexpression.

#### **ATTRIBUTES**

For an explanation of the terms used in this section, see **attributes**(7).

Interface	Attribute	Value
regcomp(), regexec()	Thread safety	MT-Safe locale
regerror()	Thread safety	MT-Safe env
regfree()	Thread safety	MT-Safe

#### **CONFORMING TO**

POSIX.1-2001, POSIX.1-2008.
