NAME

ilogb, ilogbl, ilogbl - get integer exponent of a floating-point value

SYNOPSIS

```
#include <math.h>
int ilogb(double x);
int ilogbf(float x);
int ilogbl(long double x);
Link with -lm.
```

Feature Test Macro Requirements for glibc (see **feature test macros**(7)):

ilogb():

```
_ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L || _XOPEN_SOURCE >= 500 || /* Since glibc 2.19: */ _DEFAULT_SOURCE || _/* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE ilogbf(), ilogbl(): _ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L || /* Since glibc 2.19: */ _DEFAULT_SOURCE || _SVID_SOURCE || _/* Glibc versions <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE
```

DESCRIPTION

These functions return the exponent part of their argument as a signed integer. When no error occurs, these functions are equivalent to the corresponding **logb**(3) functions, cast to *int*.

RETURN VALUE

On success, these functions return the exponent of x, as a signed integer.

If x is zero, then a domain error occurs, and the functions return **FP_ILOGB0**.

If x is a NaN, then a domain error occurs, and the functions return **FP ILOGBNAN**.

If x is negative infinity or positive infinity, then a domain error occurs, and the functions return INT_MAX.

ERRORS

See **math_error**(7) for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

Domain error: x is 0 or a NaN

An invalid floating-point exception (FE_INVALID) is raised, and *errno* is set to EDOM (but see BUGS).

Domain error: x is an infinity

An invalid floating-point exception (**FE_INVALID**) is raised, and *errno* is set to **EDOM** (but see BUGS).

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes**(7).

Interface	Attribute	Value
ilogb(), ilogbf(), ilogbl()	Thread safety	MT-Safe

CONFORMING TO

C99, POSIX.1-2001, POSIX.1-2008.

BUGS

Before version 2.16, the following bugs existed in the glibc implementation of these functions:

* The domain error case where x is 0 or a NaN did not cause *errno* to be set or (on some architectures) raise a floating-point exception.

2017-09-15

* The domain error case where x is an infinity did not cause *errno* to be set or raise a floating-point exception.
