NAME

XtCreatePopupShell, XtVaCreatePopupShell – create a popup shell

SYNTAX

Widget XtCreatePopupShell(String *name*, WidgetClass *widget_class*, Widget *parent*, ArgList *args*, Cardinal *num_args*);

Widget XtVaCreatePopupShell(String name, WidgetClass widget class, Widget parent, ...);

ARGUMENTS

args Specifies the argument list to override the resource defaults.

name Specifies the text name for the created shell widget.num_args Specifies the number of arguments in the argument list.

parent Specifies the parent widget.

widget_class Specifies the widget class pointer for the created shell widget.

... Specifies the variable argument list to override the resource defaults.

DESCRIPTION

The **XtCreatePopupShell** function ensures that the specified class is a subclass of **Shell** and, rather than using insert_child to attach the widget to the parent's children list, attaches the shell to the parent's pop-ups list directly.

A spring-loaded pop-up invoked from a translation table already must exist at the time that the translation is invoked, so the translation manager can find the shell by name. Pop-ups invoked in other ways can be created "on-the-fly" when the pop-up actually is needed. This delayed creation of the shell is particularly useful when you pop up an unspecified number of pop-ups. You can look to see if an appropriate unused shell (that is, not currently popped up) exists and create a new shell if needed.
