NAME

faked – daemon that remembers fake ownership/permissions of files manipulated by fakeroot processes.

SYNOPSIS

faked [--debug] [--foreground] [--key msg-key] [--load] [--save-file save-file] [--port TCP-port]

DESCRIPTION

If a fakeroot process wants to change the ownership of a file, then **faked** is the process that remembers that new owner. If later the same fakeroot process does a stat() for that filename, then the libfakeroot wrapped stat() call will first ask faked for the fake ownership etc of that file, and then report it.

OPTIONS

--debug

Print debugging information on stderr.

--foreground

Don't fork into the background.

--cleanup number

Cleanup the semaphores.

--key key-number

Don't allocate a new communication channel, but use channel specified by key. (If the specified channel doesn't exist, it's created).

--save-file save-file

Save the environment to save-file on exit.

—load Load a previously saved environment from the standard input.

--unknown-is-real

Use real ownership of previously-unknown files instead of setting them to root:root.

--port tcp-port

Use TCP port tcp-port.

BUGS

None so far. Be warned, though: although I've written quite a few much larger (and smaller) programs, I've never written anything that was as tiny as **fakeroot**, had as many bugs as **fakeroot**, and still was as usable as, say, **fakeroot** version 0.0_3, the first version that could be used to build itself.

COPYING

fakeroot is distributed under the GNU General Public License. (GPL 2.0 or greater).
