### **NAME**

logsave – save the output of a command in a logfile

### **SYNOPSIS**

logsave [ -asv ] logfile cmd\_prog [ ... ]

### DESCRIPTION

The **logsave** program will execute *cmd\_prog* with the specified argument(s), and save a copy of its output to *logfile*. If the containing directory for *logfile* does not exist, **logsave** will accumulate the output in memory until it can be written out. A copy of the output will also be written to standard output.

If *cmd\_prog* is a single hyphen ('-'), then instead of executing a program, **logsave** will take its input from standard input and save it in *logfile* 

**logsave** is useful for saving the output of initial boot scripts until the /var partition is mounted, so the output can be written to /var/log.

### **OPTIONS**

- -a This option will cause the output to be appended to logfile, instead of replacing its current contents.
- -s This option will cause **logsave** to skip writing to the log file text which is bracketed with a control-A (ASCII 001 or Start of Header) and control-B (ASCII 002 or Start of Text). This allows progress bar information to be visible to the user on the console, while not being written to the log file.
- **-v** This option will make **logsave** to be more verbose in its output to the user.
