Dpkg::Deps::KnownFacts(3perl)

NAME

Dpkg::Deps::KnownFacts - list of installed real and virtual packages

DESCRIPTION

This object represents a list of installed packages and a list of virtual packages provided (by the set of installed packages).

METHODS

\$facts = Dpkg::Deps::KnownFacts->new();

Creates a new object.

\$facts->add_installed_package(\$package, \$version, \$arch, \$multiarch)

Records that the given version of the package is installed. If \$version/\$arch is undefined we know that the package is installed but we don't know which version/architecture it is. \$multiarch is the Multi-Arch field of the package. If \$multiarch is undef, it will be equivalent to "Multi-Arch: no".

Note that \$multiarch is only used if \$arch is provided.

\$facts->add_provided_package(\$virtual, \$relation, \$version, \$by)

Records that the "\$by" package provides the \$virtual package. \$relation and \$version correspond to the associated relation given in the Provides field (if present).

(\$check, \$param) = \$facts->check_package(\$package)

\$check is one when the package is found. For a real package, \$param contains the version. For a virtual package, \$param contains an array reference containing the list of packages that provide it (each package is listed as [\$provider, \$relation, \$version]).

This function is obsolete and should not be used. Dpkg::Deps::KnownFacts is only meant to be filled with data and then passed to Dpkg::Deps methods where appropriate, but it should not be directly queried.

\$facts->evaluate_simple_dep()

This method is private and should not be used except from within Dpkg::Deps.

CHANGES

Version 1.01 (dpkg 1.16.1)

New option: Dpkg::Deps::KnownFacts->add_installed_package() now accepts 2 supplementary parameters (\$arch and \$multiarch).

Deprecated method: Dpkg::Deps::KnownFacts->**check_package**() is obsolete, it should not have been part of the public API.

Version 1.00 (dpkg 1.15.6)

Mark the module as public.
