NAME

argz_add, argz_add_sep, argz_append, argz_count, argz_create, argz_create_sep, argz_delete, argz_extract, argz_insert, argz_next, argz_replace, argz_stringify – functions to handle an argz list

SYNOPSIS

```
#include <argz.h>
error_t argz_add(char **argz, size_t *argz_len, const char *str);
error_t argz_add_sep(char **argz, size_t *argz_len,
            const char *str, int delim);
error t argz append(char **argz, size t *argz len,
            const char *buf, size_t buf_len);
size_t argz_count(const char *argz, size_t argz_len);
error_t argz_create(char * const argv[], char **argz,
            size_t *argz_len);
error_t argz_create_sep(const char *str, int sep, char **argz,
            size_t *argz_len);
void argz_delete(char **argz, size_t *argz_len, char *entry);
void argz_extract(const char *argz, size_t argz_len, char **argv);
error_t argz_insert(char **argz, size_t *argz_len, char *before,
            const char *entry);
char *argz_next(const char *argz, size_t argz_len, const char *entry);
error t argz replace(char ** argz, size t * argz len, const char * str,
            const char *with, unsigned int *replace count);
void argz_stringify(char *argz, size_t len, int sep);
```

DESCRIPTION

These functions are glibc-specific.

An argz vector is a pointer to a character buffer together with a length. The intended interpretation of the character buffer is an array of strings, where the strings are separated by null bytes (\0'). If the length is nonzero, the last byte of the buffer must be a null byte.

These functions are for handling argz vectors. The pair (NULL,0) is an argz vector, and, conversely, argz vectors of length 0 must have null pointer. Allocation of nonempty argz vectors is done using **malloc**(3), so that **free**(3) can be used to dispose of them again.

argz_add() adds the string str at the end of the array *argz, and updates *argz and *argz_len.

argz_add_sep() is similar, but splits the string *str* into substrings separated by the delimiter *delim*. For example, one might use this on a UNIX search path with delimiter ':'.

argz_append() appends the argz vector (*buf*, *buf_len*) after (**argz*, **argz_len*) and updates **argz* and **argz_len*. (Thus, **argz_len* will be increased by *buf_len*.)

argz_count() counts the number of strings, that is, the number of null bytes ('\0'), in (argz, argz_len).

argz_create() converts a UNIX-style argument vector *argv*, terminated by *(char *) 0*, into an argz vector (*argz, *argz_len).

argz_create_sep() converts the null-terminated string *str* into an argz vector (**argz*, **argz_len*) by breaking it up at every occurrence of the separator *sep*.

argz_delete() removes the substring pointed to by *entry* from the argz vector (*argz, *argz_len) and updates *argz and *argz_len.

argz_extract() is the opposite of **argz_create**(). It takes the argz vector (*argz*, *argz_len*) and fills the array starting at *argv* with pointers to the substrings, and a final NULL, making a UNIX-style argv vector. The

2019-03-06

array argv must have room for argz_count(argz, argz_len) + 1 pointers.

argz_insert() is the opposite of **argz_delete**(). It inserts the argument *entry* at position *before* into the argz vector (*argz, *argz_len) and updates *argz and *argz_len. If before is NULL, then *entry* will inserted at the end.

argz_next() is a function to step trough the argz vector. If *entry* is NULL, the first entry is returned. Otherwise, the entry following is returned. It returns NULL if there is no following entry.

argz_replace() replaces each occurrence of *str* with *with*, reallocating argz as necessary. If *replace_count* is non-NULL, **replace_count* will be incremented by the number of replacements.

argz_stringify() is the opposite of **argz_create_sep**(). It transforms the argz vector into a normal string by replacing all null bytes ('\0') except the last by *sep*.

RETURN VALUE

All argz functions that do memory allocation have a return type of *error_t*, and return 0 for success, and **ENOMEM** if an allocation error occurs.

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes**(7).

Interface	Attribute	Value
argz_add(), argz_add_sep(),	Thread safety	MT-Safe
argz_append(), argz_count(),		
<pre>argz_create(), argz_create_sep(),</pre>		
<pre>argz_delete(), argz_extract(),</pre>		
<pre>argz_insert(), argz_next(),</pre>		
<pre>argz_replace(), argz_stringify()</pre>		

CONFORMING TO

These functions are a GNU extension. Handle with care.

BUGS

Argz vectors without a terminating null byte may lead to Segmentation Faults.
