## **NAME**

xzmore, lzmore - view xz or lzma compressed (text) files

## **SYNOPSIS**

```
xzmore [file...] lzmore [file...]
```

## **DESCRIPTION**

**xzmore** is a filter which allows examination of  $\mathbf{xz}(1)$  or  $\mathbf{lzma}(1)$  compressed text files one screenful at a time on a soft-copy terminal.

To use a pager other than the default **more**, set environment variable **PAGER** to the name of the desired program. The name **lzmore** is provided for backward compatibility with LZMA Utils.

e or q When the prompt --More--(Next file: *file*) is printed, this command causes **xzmore** to exit.

**s** When the prompt —More—(Next file: *file*) is printed, this command causes **xzmore** to skip the next file and continue.

For list of keyboard commands supported while actually viewing the content of a file, refer to manual of the pager you use, usually **more**(1).
