NAME

IO::Lines - IO:: interface for reading/writing an array of lines

SYNOPSIS

```
use IO::Lines;
### See IO::ScalarArray for details
```

DESCRIPTION

This class implements objects which behave just like FileHandle (or IO::Handle) objects, except that you may use them to write to (or read from) an array of lines. They can be tiehandle'd as well.

This is a subclass of IO::ScalarArray in which the underlying array has its data stored in a line-oriented-format: that is, every element ends in a "\n", with the possible exception of the final element. This makes getline() *much* more efficient; if you plan to do line-oriented reading/printing, you want this class.

The print () method will enforce this rule, so you can print arbitrary data to the line-array: it will break the data at newlines appropriately.

See IO::ScalarArray for full usage and warnings.
