NAME

aptdcon - command line client for aptdaemon

SYNOPSIS

aptdcon [OPTIONS]

DESCRIPTION

aptdcon allows to perform package management tasks, e.g. installing or removing software, using aptdaemon. There isn't any need to be root to run this programme.

OPTIONS

-v, --version

Show the version number of the aptdcon.

-h, --help

Show information about the usage of the command.

-d, --debug

Show additional information on the command line.

-i, --install PACKAGES

Install the list of PACKAGES. If you want to install more than one package you have to put the package names into quotation marks.

--reinstall PACKAGES

Reinstall the list of PACKAGES. If you want to reinstall more than one package you have to put the package names into quotation marks.

-r, --remove PACKAGES

Remove the list of PACKAGES. If you want to remove more than one package you have to put the package names into quotation marks.

-p, --purge PACKAGES

Purge the list of PACKAGES. If you want to purge more than one package you have to put the package names into quotation marks.

-u, --upgrade PACKAGES

Upgrade the list of PACKAGES. If you want to upgrade more than one package you have to put the package names into quotation marks.

--upgrade-system

Upgrade the whole system.

--fix-install

Try to complete a previously cancelled installation by calling "dpkg --configure -a".

--fix-depends

Try to resolve unsatisified dependencies. Attention: Currently you don't get a confirmation of the changes, which makes this method quite dangerous since it could remove a lot of packages.

--add-vendor-key PUBLIC KEY FILE

Install the PUBLIC_KEY_FILE to authenticate and trust packages singed by the vendor.

--add-vendor-key-from-keyserver PUBLIC KEY ID

Download and install the PUBLIC_KEY_ID to authenticate and trust packages singed by the vendor. Requires the --keyserver to be set.

--key-server KEYSERVER

Download vendor keys from the given KEYSERVER.

--remove-vendor-key FINGERPRINT

Remove the vendor key of the given FINGERPRINT to no longer trust packages from this vendor.

--add-repository 'DEB_LINE'

Allow to install software from the repository specified by the given DEB_LINE. You have to put quotation marks around the DEB_LINE since it normally contains spaces: 'deb http://ftp.de.debian.org/debian unstable main'

--sources-file SOURCES_FILE

Specify an alternative sources file to which the new repository should be written. SOURCES_FILE should be only the basename: backports.list

--list-trusted-vendors

Show all trusted software vendors and theirs keys.

--hide-terminal

Do not attach to the interactive terminal of the underlying dpkg call.

--allow-unauthenticated

Allow to install packages which are not from a trusted vendor.

EXAMPLES

The following command will install the package xterm and remove the package eterm in the same run: \$ aptdcon --install "xterm" --remove "eterm"

To handle more than one package the names have to be put into quotation marks. The following command will install xterm and eterm:

\$ aptdcon --install "xterm eterm"

The following command will add the backport repository to the sources.list in a separate file /etc/apt/sources.list.d/backports.list:

\$ aptdcon --sources-file backports.list \

--add-repostiry "deb http://archive.backports.org/debian stable main"

DIAGNOSTICS

By default aptdaemon logs to the syslog facility AptDaemon. Furthermore you can use the -d option to get additional information on the command line.
