# **NAME**

XtPopup, XtPopupSpringLoaded, XtCallbackNone, XtCallbackNonexclusive, XtCallbackExclusive apop-up

### **SYNTAX**

```
void XtPopup(Widget popup_shell, XtGrabKind grab_kind);
void XtPopupSpringLoaded(Widget popup_shell);
void XtCallbackNone(Widget w, XtPointer client_data, XtPointer call_data):
void XtCallbackNonexclusive(Widget w, XtPointer client_data, XtPointer call_data);
void XtCallbackExclusive(Widget w, XtPointer client_data, XtPointer call_data);
void MenuPopup(String shell_name);
```

### **ARGUMENTS**

call\_data Specifies the callback data, which is not used by this procedure.

*client\_data* Specifies the pop-up shell.

grab kind Specifies the way in which user events should be constrained.

popup\_shell Specifies the widget shell.w Specifies the widget.

### **DESCRIPTION**

The **XtPopup** function performs the following:

- Calls **XtCheckSubclass** to ensure popup\_shell is a subclass of **Shell**.
- Generates an error if the shell's popped\_up field is already **True**.
- Calls the callback procedures on the shell's popup\_callback list.
- Sets the shell popped\_up field to **True**, the shell spring\_loaded field to **False**, and the shell grab\_kind field from grab\_kind.
- If the shell's create\_popup\_child field is non-NULL, **XtPopup** calls it with popup\_shell as the parameter.
- If grab\_kind is either **XtGrabNonexclusive** or **XtGrabExclusive**, it calls:

Calls XMapWindow with popup\_shell specified.

The **XtPopupSpringLoaded** function performs exactly as **XtPopup** except that it sets the shell *spring\_loaded* field to **True** and always calls **XtAddGrab** with *exclusive* **True** and *spring\_loaded* **True**.

The XtCallbackNone, XtCallbackNonexclusive, and XtCallbackExclusive functions call XtPopup with the shell specified by the client data argument and grab\_kind set as the name specifies. XtCallbackNone, XtCallbackNonexclusive, and XtCallbackExclusive specify XtGrabNone, XtGrabNonexclusive, and XtGrabExclusive, respectively. Each function then sets the widget that executed the callback list to be insensitive by using XtSetSensitive. Using these functions in callbacks is not required. In particular,

an application must provide customized code for callbacks that create pop-up shells dyn must do more than desensitizing the button.

**MenuPopup** is known to the translation manager, which must perform special actions a pop-ups. Calls to **MenuPopup** in a translation specification are mapped into calls to a procedure, and the translation manager fills in parameters based on the event specified of a translation.

If **MenuPopup** is invoked on **ButtonPress** (possibly with modifiers), the translation man shell with grab\_kind set to **XtGrabExclusive** and spring\_loaded set to **True**. If **MenuPo** on **EnterWindow** (possibly with modifiers), the translation manager pops up the shell with to **XtGrabNonexclusive** and spring\_loaded set to **False**. Otherwise, the translation manager error. When the widget is popped up, the following actions occur:

- Calls **XtCheckSubclass** to ensure popup\_shell is a subclass of **Shell**.
- Generates an error if the shell's popped\_up field is already **True**.
- Calls the callback procedures on the shell's popup\_callback list.
- Sets the shell popped\_up field to True and the shell grab\_kind and spring\_loaded fields appropriately.
- If the shell's create\_popup\_child field is non-NULL, it is called with popup\_shell as the parameter.
- Calle

• Calls **XMapWindow** with popup\_shell specified.

(Note that these actions are the same as those for **XtPopup**.) **MenuPopup** tries to find the shell by searching the widget tree starting at the parent of the widget in which it is invoked. If it finds a shell with the specified name in the pop-up children of that parent, it pops up the shell with the appropriate parameters. Otherwise, it moves up the parent chain as needed. If **MenuPopup** gets to the application widget and cannot find a matching shell, it generates an error.
