NAME

pthread_rwlockattr_setkind_np, pthread_rwlockattr_getkind_np - set/get the read-write lock kind of the thread read-write lock attribute object

SYNOPSIS

```
#include <pthread.h>
```

Compile and link with -pthread.

Feature Test Macro Requirements for glibc (see **feature_test_macros**(7)):

```
\label{eq:pthread_rwlockattr_setkind_np} \begin{split} & pthread\_rwlockattr\_setkind\_np(), \ pthread\_rwlockattr\_getkind\_np(): \\ & \_XOPEN\_SOURCE >= 500 \parallel \_POSIX\_C\_SOURCE >= 200809L \end{split}
```

DESCRIPTION

The **pthread_rwlockattr_setkind_np**() function sets the "lock kind" attribute of the read-write lock attribute object referred to by *attr* to the value specified in *pref*. The argument *pref* may be set to one of the following:

PTHREAD_RWLOCK_PREFER_READER_NP

This is the default. A thread may hold multiple read locks; that is, read locks are recursive. According to The Single Unix Specification, the behavior is unspecified when a reader tries to place a lock, and there is no write lock but writers are waiting. Giving preference to the reader, as is set by **PTHREAD_RWLOCK_PREFER_READER_NP**, implies that the reader will receive the requested lock, even if a writer is waiting. As long as there are readers, the writer will be starved.

PTHREAD_RWLOCK_PREFER_WRITER_NP

This is intended as the write lock analog of PTHREAD_RWLOCK_PREFER_READER_NP. This is ignored by glibc because the POSIX requirement to support recursive writer locks would cause this option to create trivial deadlocks; instead use PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP which ensures the application developer will not take recursive read locks thus avoiding deadlocks.

PTHREAD RWLOCK PREFER WRITER NONRECURSIVE NP

Setting the lock kind to this avoids writer starvation as long as any read locking is not done in a recursive fashion.

The **pthread_rwlockattr_getkind_np**() function returns the value of the lock kind attribute of the read-write lock attribute object referred to by *attr* in the pointer *pref*.

RETURN VALUE

On success, these functions return 0. Given valid pointer arguments, **pthread_rwlockattr_getkind_np**() always succeeds. On error, **pthread_rwlockattr_setkind_np**() returns a nonzero error number.

ERRORS

EINVAL

pref specifies an unsupported value.

VERSIONS

The pthread_rwlockattr_getkind_np() and pthread_rwlockattr_setkind_np() functions first appeared in glibc 2.1.

CONFORMING TO

These functions are non-standard GNU extensions; hence the suffix " np" (nonportable) in the names.
