#### **NAME**

nmcli-examples - usage examples of nmcli

#### **SYNOPSIS**

nmcli [OPTIONS...]

#### DESCRIPTION

nmcli is a command-line client for NetworkManager. It allows controlling NetworkManager and reporting its status. For more information please refer to **nmcli**(1) manual page.

The purpose of this manual page is to provide you with various examples and usage scenarios of *nmcli*.

#### **EXAMPLES**

## Example 1. Listing available Wi-Fi APs

# \$ nmcli device wifi list \* SSID

```
MODE CHAN RATE
                               SIGNAL BARS SECURITY
netdatacomm_local Infra 6 54 Mbit/s 37 __ WEP
    Infra 11 54 Mbit/s 98 WPA1
                                _ WPA2 802.1X
LoremCorp Infra 1 54 Mbit/s 62
Internet
          Infra 6 54 Mbit/s 29
                                 WPA1
HPB110a.F2672A Ad-Hoc 6 54 Mbit/s 22
                              ___ WEP
Jozinet Infra 1 54 Mbit/s 19
VOIP
          Infra 1 54 Mbit/s 20
MARTINA
            Infra 4 54 Mbit/s 32 __ WPA2

           Infra 7 11 Mbit/s 22
                             _ WPA2
alfa
         Infra 1 54 Mbit/s 67
         Infra 5 54 Mbit/s 20
                             ___ WPA1 WPA2
bertnet
```

This command shows how to list available Wi-Fi networks (APs). You can also use -- fields option for displaying different columns. **nmcli -f all dev wifi list** will show all of them.

# Example 2. Showing general information and properties for a Wi-Fi interface

# \$ nmcli -p -f general, wifi-properties device show wlan0

Device details (wlan0) GENERAL.DEVICE: wlan0 GENERAL.TYPE: GENERAL. VENDOR: **Intel Corporation** GENERAL.PRODUCT: PRO/Wireless 5100 AGN [Shiloh] Network Connection GENERAL.DRIVER: iwlwifi GENERAL.DRIVER-VERSION: 3.8.13-100.fc17.x86 64 GENERAL.FIRMWARE-VERSION: 8.83.5.1 build 33692 GENERAL.HWADDR: 00:1E:65:37:A1:D3 1500 GENERAL.MTU:

100 (connected) GENERAL.STATE: GENERAL.REASON: 0 (No reason given)

/sys/devices/pci0000:00/0000:00:1c.1/net/wlan0 GENERAL.UDI:

GENERAL.IP-IFACE: wlan0 GENERAL.IS-SOFTWARE: GENERAL.NM-MANAGED: GENERAL.AUTOCONNECT: yes GENERAL.FIRMWARE-MISSING: no GENERAL.CONNECTION: My Alfa WiFi

GENERAL.CON-UUID: 85194f4c-d496-4eec-bae0-d880b4cbcf26

GENERAL.CON-PATH: /org/freedesktop/NetworkManager/ActiveConnection/

WIFI-PROPERTIES.WPA2: yes
WIFI-PROPERTIES.TKIP: yes
WIFI-PROPERTIES.CCMP: yes
WIFI-PROPERTIES.AP: no
WIFI-PROPERTIES.ADHOC: yes

\_\_\_\_\_\_

This command shows information about a Wi-Fi device.

#### **Example 3. Listing NetworkManager polkit permissions**

## \$ nmcli general permissions

```
PERMISSION
                                         VALUE
org. free desktop. Network Manager. en able-disable-network\\
                                                        ves
org.freedesktop.NetworkManager.enable-disable-wifi
org.freedesktop.NetworkManager.enable-disable-wwan
                                                        ves
org.freedesktop.NetworkManager.enable-disable-wimax
                                                        yes
org.freedesktop.NetworkManager.sleep-wake
org.freedesktop.NetworkManager.network-control
                                                     yes
org.freedesktop.NetworkManager.wifi.share.protected
                                                     yes
org.freedesktop.NetworkManager.wifi.share.open
                                                    yes
org.freedesktop.NetworkManager.settings.modify.system
org.freedesktop.NetworkManager.settings.modify.own
org.freedesktop.NetworkManager.settings.modify.hostname auth
org.freedesktop.NetworkManager.settings.modify.global-dns auth
org.freedesktop.NetworkManager.reload
```

This command shows configured polkit permissions for various NetworkManager operations. These permissions or actions (using polkit language) are configured by a system administrator and are not meant to be changed by users. The usual place for the polkit configuration is /usr/share/polkit-1/actions/org.freedesktop.NetworkManager.policy. *pkaction* command can display description for polkit actions.

### pkaction --action-id org.freedesktop.NetworkManager.network-control --verbose

More information about polkit can be found at http://www.freedesktop.org/wiki/Software/polkit.

### Example 4. Listing NetworkManager log level and domains

## \$ nmcli general logging

LEVEL DOMAINS

INFO PLATFORM,RFKILL,ETHER,WIFI,BT,MB,DHCP4,DHCP6,PPP,WIFI\_SCAN,IP4,IP6,A UTOIP4,DNS,VPN,SHARING,SUPPLICANT,AGENTS,SETTINGS,SUSPEND,CORE,DEVICE,OLPC, WIMAX,INFINIBAND,FIREWALL,ADSL,BOND,VLAN,BRIDGE,DBUS\_PROPS,TEAM,CONCHECK,DC B,DISPATCH

This command shows current NetworkManager logging status.

## Example 5. Changing NetworkManager logging

```
$ nmcli g log level DEBUG domains CORE,ETHER,IP
$ nmcli g log level INFO domains DEFAULT
```

The first command makes NetworkManager log in DEBUG level, and only for CORE, ETHER and IP

domains. The second command restores the default logging state. Please refer to the **NetworkManager.conf**(5) manual page for available logging levels and domains.

#### Example 6. Activating a VPN connection profile requiring interactive password input

#### \$ nmcli --ask con up my-vpn-con

This command activates a VPN connection profile enabling nmcli to interact with the user ('—ask'): this will allow nmcli to prompt for the VPN password on the command line when the *password–flags* are set to '0x02' ('always ask', see **nm-settings**(5)). This is particularly useful for OTP based VPNs, as the user needs to be prompted for the password each time the connection is activated.

#### Example 7. Adding a bonding master and two slave connection profiles

- \$ nmcli con add type bond ifname mybond0 mode active-backup
- \$ nmcli con add type ethernet ifname eth1 master mybond0
- \$ nmcli con add type ethernet ifname eth2 master mybond0

This example demonstrates adding a bond master connection and two slaves. The first command adds a master bond connection, naming the bonding interface *mybond0* and using *active-backup* mode. The next two commands add slaves connections, both enslaved to *mybond0*. The first slave will be bound to *eth1* interface, the second to *eth2*.

## Example 8. Adding a team master and two slave connection profiles

- \$ nmcli con add type team con-name Team1 ifname Team1 config team1-master-json.conf
- \$ nmcli con add type ethernet con-name Team1-slave1 ifname em1 master Team1
- \$ nmcli con add type ethernet con-name Team1-slave2 ifname em2 master Team1

This example demonstrates adding a team master connection profile and two slaves. It is very similar to the bonding example. The first command adds a master team profile, naming the team interface and the profile *Team1*. The team configuration for the master is read from *team1-master-json.conf* file. Later, you can change the configuration with *modify* command (**nmcli con modify Team1 team.config team1-master-another-json.conf**). The last two commands add slaves profiles, both enslaved to *Team1*. The first slave will be bound to *em1* interface, the second to *em2*. The slaves don't specify *config* and thus *teamd* will use its default configuration. You will activate the whole setup by activating both slaves:

\$ nmcli con up Team1-slave1 \$ nmcli con up Team1-slave2

By default, the created profiles are marked for auto-activation. But if another connection has been activated on the device, the new profile won't activate automatically and you need to activate it manually.

### Example 9. Adding a bridge and two slave profiles

- \$ nmcli con add type bridge con-name TowerBridge ifname TowerBridge
- \$ nmcli con add type ethernet con-name br-slave-1 ifname ens3 master TowerBridge
- \$ nmcli con add type ethernet con-name br-slave-2 ifname ens4 master TowerBridge
- \$ nmcli con modify TowerBridge bridge.stp no

This example demonstrates adding a bridge master connection and two slaves. The first command adds a master bridge connection, naming the bridge interface and the profile as *TowerBridge*. The next two commands add slaves profiles, both will be enslaved to *TowerBridge*. The first slave will be tied to *ens3* interface, the second to *ens4*. The last command will disable 802.1D STP for the TowerBridge profile.

## Example 10. Adding an ethernet connection profile with manual IP configuration

\$ nmcli con add con-name my-con-em1 ifname em1 type ethernet \ ip4 192.168.100.100/24 gw4 192.168.100.1 ip4 1.2.3.4 ip6 abbe::cafe \$ nmcli con mod my-con-em1 ipv4.dns "8.8.8 8.8.4.4"

\$ nmcli con mod my-con-em1 +ipv4.dns 1.2.3.4 \$ nmcli con mod my-con-em1 ipv6.dns "2001:4860:4860::8888 2001:4860:4860::8844" \$ nmcli -p con show my-con-em1

The first command adds an Ethernet connection profile named my–con–em1 that is bound to interface name em1. The profile is configured with static IP addresses. Three addresses are added, two IPv4 addresses and one IPv6. The first IP 192.168.100.100 has a prefix of 24 (netmask equivalent of 255.255.255.0). Gateway entry will become the default route if this profile is activated on em1 interface (and there is no connection with higher priority). The next two addresses do not specify a prefix, so a default prefix will be used, i.e. 32 for IPv4 and 128 for IPv6. The second, third and fourth commands modify DNS parameters of the new connection profile. The last  $con\ show$  command displays the profile so that all parameters can be reviewed.

#### Example 11. Convenient field values retrieval for scripting

\$ nmcli -g ip4.address connection show my-con-eth0 192.168.1.12/24

\$ nmcli -g ip4.address,ip4.dns connection show my-con-eth0 192.168.1.12/24 192.168.1.1

## \$ nmcli -g ip4 connection show my-con-eth0

IP4:192.168.1.12/24:192.168.1.1::192.168.1.1::

This example shows retrieval of ip4 connection field values via the —get—values option. Multiple comma separated fields can be provided: they will be printed one per line. If a whole section is provided instead of a single field, the name of the section will be printed followed by all the related field values on the same line. See also —terse, —mode, —fields and —escape options in **nmcli**(1) manual page for more customized output.

## Example 12. Adding an Ethernet connection and configuring SR-IOV VFs

\$ nmcli con add type ethernet con-name EthernetPF ifname em1
\$ nmcli con modify EthernetPF sriov.total-vfs 3 sriov.autoprobe-drivers false
\$ nmcli con modify EthernetPF sriov.vfs '0 mac=00:11:22:33:44:55 vlans=10, 1 trust=true spoof-check=false'

This example demonstrates adding an Ethernet connection for physical function (PF) *ens4* and configuring 3 SR–IOV virtual functions (VFs) on it. The first VF is configured with MAC address 00:11:22:33:44:55 and VLAN 10, the second one has the *trust* and *spoof–check* features respectively enabled and disabled. VF number 2 has a maximux transmission rate of 20Mbps. The kernel is instructed to not automatically instantiate a network interface for the VFs.

#### Example 13. Escaping colon characters in tabular mode

\$ nmcli con modify EthernetPF +sriov.vfs '2 max-tx-rate=20'

## \$ nmcli -t -f general -e yes -m tab dev show eth0

GENERAL:eth0:ethernet:Intel Corporation:82567LM Gigabit Network Connection: e1000e:2.1.4–k:1.8–3:00\:22\:68\:15\:29\:21:1500:100 (connected):0 (No reas on given):/sys/devices/pci0000\:00/0000\:00\:19.0/net/eth0:eth0:yes:yes:no: ethernet-13:89cbcbc6-dc85-456c-9c8b-bd828fee3917:/org/freedesktop/NetworkMa nager/ActiveConnection/9

This example shows escaping colon characters in tabular mode. It may be useful for script processing, because ':' is used as a field separator.

Example 14. nmcli usage in a NetworkManager dispatcher script to make Ethernet and Wi-Fi mutually exclusive

```
#!/bin/bash
export LC_ALL=C
enable_disable_wifi ()
{
    result=$(nmcli dev | grep "ethernet" | grep -w "connected")
    if [ -n "$result" ]; then
        nmcli radio wifi off
    else
        nmcli radio wifi on
    fi
}

if [ "$2" = "up" ]; then
    enable_disable_wifi
fi

if [ "$2" = "down" ]; then
    enable_disable_wifi
fi
```

This dispatcher script makes Wi–Fi mutually exclusive with wired networking. When a wired interface is connected, Wi–Fi will be set to airplane mode (rfkilled). When the wired interface is disconnected, Wi–Fi will be turned back on. Name this script e.g. 70–wifi–wired–exclusive.sh and put it into /etc/NetworkManager/dispatcher.d/ directory. See **NetworkManager**(8) manual page for more information about NetworkManager dispatcher scripts.

## Example sessions of interactive connection editor

#### Example 15. Adding an ethernet connection profile in interactive editor (a)

## \$ nmcli connection edit type ethernet

```
=== nmcli interactive connection editor |===
```

Adding a new '802-3-ethernet' connection

Type 'help' or '?' for available commands.

Type 'describe [<setting>.<prop>]' for detailed property description.

You may edit the following settings: connection, 802–3–ethernet (ethernet), 802–1x, ipv4, ipv6, dcb nmcli> **print** 

\_\_\_\_\_\_

#### Connection details

nmcli> verify
Verify connection: OK
nmcli> save
Connection 'ethernet-4' (de89cdeb-a3e1-4d53-8fa0-c22546c775f4) successfully
saved.
nmcli> quit
```

Example session in the nmcli interactive connection editor. The scenario creates an Ethernet connection profile with static addressing (IPs and DNS).
