#### **NAME**

XtAppInitialize, XtVaAppInitialize - initialize, open, or close a display

# **SYNTAX**

Widget XtAppInitialize(XtAppContext\* app\_context\_return, String application\_class, XrmOptionDescRec\* options, Cardinal num\_options, int\* argc\_in\_out, String\* argv\_in\_out, String\* fall-back\_resources, ArgList args, Cardinal num\_args);

Widget XtVaAppInitialize(XtAppContext\* app\_context\_return, String application\_class, XrmOptionDescRec\* options, Cardinal num\_options, int\* argc\_in\_out, String\* argv\_in\_out, String\* fall-back resources, ...);

# **ARGUMENTS**

app\_context\_return

Specifies the application context.

application\_class

Specifies the class name of this application, which usually is the generic name for all in-

stances of this application.

options Specifies how to parse the command line for any application-specific resources. The op-

tions argument is passed as a parameter to XrmParseCommand. For further informa-

tion, see Xlib - C Language X Interface.

*num\_options* Specifies the number of entries in the options list.

argc\_in\_out Specifies a pointer to the number of command line parameters.

*argv\_in\_out* Specifies the command line parameters.

fallback\_resources

Specifies resource values to be used if the application class resource file cannot be opened

or read, or NULL.

args Specifies the argument list to override any other resource specification for the created

shell widget.

*num\_args* Specifies the number of entries in the argument list.

... Specifies the variable argument list to override any other resource specification for the

created shell widget.

#### DESCRIPTION

The **XtAppInitialize** function calls **XtToolkitInitialize** followed by **XtCreateApplicationContext**, then calls **XtOpenDisplay** with *display\_string* NULL and *application\_name* NULL, and finally calls **XtAppCreateShell** with *application\_name* NULL, *widget\_class* **applicationShellWidgetClass**, and the specified *args* and *num\_args* and returns the created shell. The modified *argc* and *argv* returned by **XtDisplayInitialize** are returned in *argc\_in\_out* and *argv\_in\_out*. If *app\_context\_return* is not NULL, the created application context is also returned. If the display specified by the command line cannot be opened, an error message is issued and **XtAppInitialize** terminates the application. If *fallback\_resources* is non-NULL, **XtAppSetFallbackResources** is called with the value prior to calling **XtOpenDisplay**.

XtAppInitialize and XtVaAppInitialize have been superceded by **XtOpenApplication** and **XtVaOpenApplication** and **XtVaOpenApplication** respectively.
