NAME

Net::DNS::RR::RP – DNS RP resource record

SYNOPSIS

```
use Net::DNS;
$rr = new Net::DNS::RR('name RP mbox txtdname');
```

DESCRIPTION

Class for DNS Responsible Person (RP) resource records.

METHODS

The available methods are those inherited from the base class augmented by the type-specific methods defined in this package.

Use of undocumented package features or direct access to internal data structures is discouraged and could result in program termination or other unpredictable behaviour.

mbox

```
$mbox = $rr->mbox;
$rr->mbox( $mbox );
```

A domain name which specifies the mailbox for the person responsible for this domain. The format in master files uses the DNS encoding convention for mailboxes, identical to that used for the RNAME mailbox field in the SOA RR. The root domain name (just ".") may be specified to indicate that no mailbox is available.

txtdname

```
$txtdname = $rr->txtdname;
$rr->txtdname( $txtdname );
```

A domain name identifying TXT RRs. A subsequent query can be performed to retrieve the associated TXT records. This provides a level of indirection so that the entity can be referred to from multiple places in the DNS. The root domain name (just ".") may be specified to indicate that there is no associated TXT RR.
