NAME
gvfsd-metadata − Metadata daemon for gvfs

SYNOPSIS
gvfs−metadata [OPTION...]

DESCRIPTION
gvfsd−metadata is a daemon acting as a write serialiser to the internal gvfs metadata storage. It is autostarted by GIO clients when they make metadata changes. Read operations are done by client−side GIO code directly, and don't require the daemon to be running.

The gvfs metadata capabilities are used by the nautilus file manager, for example.

OPTIONS
−h, **−−help**
Prints a short help text and exits.

−−version
Shows the version number and exits.

−r, **−−replace**
Replace the currently running instance.

EXIT STATUS
On success 0 is returned, a non−zero failure code otherwise.

FILES
$XDG_DATA_HOME/gvfs−metadata
The directory where the gvfs metadata database files are stored
