NAME
       selection−popup − (enabled by default)

DESCRIPTION
       Binds a popup menu to Ctrl−Button3 that lets you paste the X selections and either modify or use the internal selection text in various ways (such as uri unescaping, perl evaluation, web-browser starting etc.), depending on content.

       Other extensions can extend this popup menu by pushing a code reference onto `@{ $term->{selection_popup_hook} }`, which gets called whenever the popup is being displayed.

       Its sole argument is the popup menu, which can be modified. The selection is in `$_`, which can be used to decide whether to add something or not. It should either return nothing or a string and a code reference. The string will be used as button text and the code reference will be called when the button gets activated and should transform `$_`.

       The following will add an entry `a to b` that transforms all `a`s in the selection to `b`s, but only if the selection currently contains any `a`s:

```
push @{ $self->{term}{selection_popup_hook} }, sub {
   /a/ ? ("a to b" => sub { s/a/b/g }
       : ()
};
```
