NAME
      deb−postinst − package post-installation maintainer script

SYNOPSIS
      postinst

DESCRIPTION
      A package can perform several post-installation actions via maintainer scripts, by including an executable
      postinst file in its control archive (i.e. *DEBIAN/postinst* during package creation).

      The script can be called in the following ways:

      postinst **configure** *old-version*
            After the package was installed.

      postinst **triggered** *trigger-name...*
            After the package was triggered.

      old-postinst **abort-upgrade** *new-version*
            If *prerm* fails during upgrade or fails on failed upgrade.

      old-postinst **abort-remove**
            If *prerm* fails during removal.

      postinst **abort-deconfigure in-favour** *new-package new-version*
          [**removing** *old-package old-version*]
            If *prerm* fails during deconfiguration of a package.

      postinst **abort-remove in-favour** *new-package new-version*
            If *prerm* fails during replacement due to conflict.
