NAME

tzselect − view timezones

SYNOPSIS

tzselect

DESCRIPTION

This manual page explains how you can use the **tzselect** utility to view the installed timezone. It comes handy when you want to know what time it is in other countries, or if you just wonder what timezones exist.

tzselect is called without any parameters from the shell. It shows a list of about one dozen geographic areas one can roughly recognize as continents. After choosing a geographic area by number, a list of countries and cities in this area will be shown.

You can press the **Enter** key to reprint the list. To choose a timezone, just press the number left to it. If your input is invalid, the list will be reprinted.

You may press **Ctrl-C** to interrupt the script at any time.

Note that **tzselect** will not actually change the timezone for you. Use 'dpkg-reconfigure tzdata' to achieve this.
