NAME
        x11perfcomp − X11 server performance comparison program

SYNTAX
        x11perfcomp [−r | −ro] [−l label_file] files

DESCRIPTION
        The *x11perfcomp* program merges the output of several *x11perf(1)* runs into a nice tabular format. It takes
        the results in each file, fills in any missing test results if necessary, and for each test shows the objects/sec-
        ond rate of each server. If invoked with the -r or -ro options, it shows the relative performance of each
        server to the first server.

        Normally, *x11perfcomp* uses the first file specified to determine which specific tests it should report on.
        Some (non-DEC :) servers may fail to perform all tests. In this case, *x11perfcomp* automatically substitutes
        in a rate of 0.0 objects/second. Since the first file determines which tests to report on, this file must contain
        a superset of the tests reported in the other files, else *x11perfcomp* will fail.

        You can provide an explicit list of tests to report on by using the -l switch to specify a file of labels. You
        can create a label file by using the -label option in *x11perf.*

OPTIONS
        x11perfcomp accepts the options listed below:

        −r   Specifies that the output should also include relative server performance.

        −ro   Specifies that the output should include only relative server performance.

        −l label_file   Specifies a label file to use.

X DEFAULTS
        There are no X defaults used by this program.

SEE ALSO
