NAME

XML::Parser::Style::Subs – glue for handling element callbacks

SYNOPSIS

```
use XML::Parser;
my $p = XML::Parser->new(Style => 'Subs', Pkg => 'MySubs');
$p->parsefile('foo.xml');

{
  package MySubs;

  sub foo {
    # start of foo tag
  }

  sub foo_ {
    # end of foo tag
  }
}
```

DESCRIPTION

Each time an element starts, a sub by that name in the package specified by the Pkg option is called with the same parameters that the Start handler gets called with.

Each time an element ends, a sub with that name appended with an underscore ("_"), is called with the same parameters that the End handler gets called with.

Nothing special is returned by parse.
